Documented code version

All the improvements referenced in this document are for:

Version V1.3.33 or later

Improvements in version 66

Overview of improvements (Version 66)

Location of the XML:

The option of locating XML data in several languages is now included.

POIs in the offers:

To supplement the description, a series of references (POI, "Point Of Interest") is included in the offers to provide a taxonomy.

New functions and changes (Version 66)

Only a functional summary of the new functions is provided. See the documentation for further details.

Location

SOAP_GetAllLanguage (new) Informative function. Returns all the languages registered in the database.

POI system

SOAP_GetAllRatesPackages (new) Returns the possible POIs of an offer.

SOAP_GetLeisureServiceAvailability (change) Now contains a structure which shows the make-up of the package.

SOAP_GetHotelPackageAvailability (change) Now contains a structure which shows the make-up of the package.

SOAP_GetAllHotelAvailability (change) Now contains a structure which shows the make-up of the package.

Improvements in version 65

Overview of improvements (Version 65)

Cancellation process:

The following option has been included:

- Cancel the bookings through XML.
- Know the cancellation conditions and charges in XML format.

Anonymous bookings:

The possibility of making **anonymous bookings** is now included, meaning the **exact conditions of the package** can be known without having to identify the potential purchaser or the process which is interacting. If the purchase is subsequently formalised, the purchaser can be identified and the booking closed.

Information on bookings

This allows us to obtain information on a previously made booking.

Improvements in category and geographical references

References to the lowest level geographical entity they form part of have been included in the informative hotel functions. A numerical reference to the hotel category is also included.

New functions and changes

Only a functional summary of the new functions is provided. See the documentation for further details.

Cancellation

SOAP_GetBookingStatusTypes (new) Informative function which returns the possible statuses of a booking cancellation.

SOAP_CancelBooking (new) Used to request a booking cancellation.

Anonymous bookings

SOAP_SetBooking (change) Identifying the purchaser in SetBooking is now optional. A “simul” field is included, which makes the booking simulated rather than real.

SOAP_IdentifyBooking (new) Can be used to add purchaser details to a previously made booking, meaning it can be identified.

Information on bookings

SOAP_GetInfoBooking Provides information on a previously made booking.

SOAP_CancelBooking Can be used to request a booking cancellation.

Geographical references

SOAP_GetHotelsDirectory: Includes numerical references to the hotel category, plus the town and country where the hotel is located.

SOAP_GetHotelInfo: Includes a numerical reference to the hotel category.
